

[**PROJECT** : BATTERY-BACKED AI COMPUTE · MEAD, OKLAHOMA · US-70]

MEAD DATA CENTER

A 30-GPU NVIDIA B200 cluster on land, power, and buildings we already own — with six anchor tenants committing 100% of capacity, a signed-quote fiber path, and batteries from our own company behind the meter.

the site is the moat →

30x NVIDIA B200 GPUS	100G SYMMETRICAL DIA FIBER	3 MVA ON-SITE TRANSFORMER	\$2.0M ALL-IN BUILD W/ CONTINGENCY	34% MODELED YEAR-1 CASH YIELD
--	--	---	--	---

COMPUTE IS THE COMMODITY. CHEAP POWER IS THE EDGE.

AI compute demand keeps outrunning supply. The B200 — NVIDIA's current-generation workhorse — rents at a market median of **\$6.25/GPU-hour** across 67 tracked providers this month, with hyperscalers charging \$14–18/hr for the identical silicon. The spread between what compute costs to operate and what it rents for is the business.

[MARKET · JULY 2026] \$6.25/HR B200 median across 67 providers (independent index, July 2026). Range: \$2.69 spot → \$16.11 hyperscaler.	[OUR PRICE] \$4.50/HR Modeled reserved anchor rate — ask \$5.00, model the landing at \$4.50, 28% under median. Priced to sign 1-year 24/7 commitments.	[OUR COST] ~\$2.14/HR All-in cash operating cost per rented GPU-hour — power, fiber, full 2-engineer team, insurance. A >50% cash margin at the modeled rate.
---	--	---

[WHY THIS PROJECT CLEARS THE MARKET]

TYPICAL GPU CLOUD ENTRANT	MEAD DATA CENTER
Leases colo space at \$0.12–0.25/kWh	Owns the site. Oklahoma power at ~\$0.08/kWh, behind-the-meter batteries from z1Power — a company we own.
Waits 12–24 months for grid interconnection	3 MVA transformer already on site. The 110 kW Phase-1 load uses under 4% of it.
Buys demand with marketing spend	Six anchor tenants — 100% of capacity pre-committed before a single server is ordered. Signatures + prepaid Q1 (~\$296K) are the go/no-go gate.
Rents bandwidth at metro prices	Signed carrier quote in hand: Dobson Fiber 100 Gbps symmetrical DIA, \$8,075/mo on 60-month term, install waived.

\$686K

Modeled Year-1 net operating cash flow on \$1.18M of fully contracted revenue — a 58% operating margin, before any debt. Every figure in this memorandum survived a multi-pass independent audit against July 2026 market data: full-market engineer salaries, the signed fiber quote, and rates modeled at the negotiated landing — not the ask. Year 2 onward is priced *lower* as newer chips ship. The upside case is rates simply holding.

MOST GPU STARTUPS RENT THEIR MOAT. **WE HOLD TITLE.**

Phase 1 requires zero real-estate spend, zero interconnection queue, and zero retail battery markup. The infrastructure below is contributed to the project by the sponsor — investor capital buys compute, not dirt.

[LAND]

30 ACRES - US-70

Owned outright in Mead, OK. Room for ~500 kW of solar on 2–3 acres if we ever want generation on site — 27 acres of expansion headroom after that.

[BUILDINGS]

3 * 3,000 SQFT

Three existing structures. Phase 1 occupies one; the HVAC retrofit (\$150K, in budget) is the only building spend. Buildings 2–3 are pre-built Phase 2/3 shells.

[POWER]

3,000 KVA - 208V 3Φ

On-site transformer with ~20× headroom over the Phase-1 IT load. DGX/HGX B200 accepts 200–240V 3-phase natively. Oklahoma commercial power ≈ \$0.08/kWh.

[BATTERIES]

Z1POWER LFP + UPS

We own z1Power.com — LFP battery systems land in the build at cost (\$80K vs ~\$280K retail). Ride-through, peak-shaving, and a clean-power story tenants can cite.

[CONNECTIVITY · SIGNED CARRIER QUOTE — NOT AN ESTIMATE]

100 GBPS

Symmetrical Dedicated Internet Access — Dobson Fiber. \$8,075/mo on a 60-month agreement, installation waived, ~90-day build. Symmetrical matters: tenants pull checkpoints and model weights *out* as fast as they push data in. 100G moves ~45 TB/hour — ample for 30 GPUs of fine-tuning and inference traffic, with a mid-contract capacity upgrade path to negotiate before signing.

SPONSOR CONTRIBUTION

Site, buildings, transformer, fiber contract, z1Power hardware at cost, and day-to-day operations are contributed by SmartTec. Investor capital is spent on one thing: **revenue-generating compute.**

\$2.0M ALL-IN. NEW HARDWARE. AUDITED LINES.

HGX-architecture servers from Supermicro/Dell carry the same NVIDIA B200 silicon as DGX. Comparable systems now benchmark at \$280-320K new — so the build is priced on new hardware with full warranty, not refurb. Every line survived a multi-pass audit; 15% contingency is carried openly.

ITEM	COST	NOTE
4× HGX B200 servers, new (8 GPUs each — 32 total, 30 rentable)	\$1,200,000	\$300K/system at July 2026 benchmark pricing — full warranty, no refurb risk on tenant SLAs.
InfiniBand fabric — 1× QM9790 (or 400G RoCE)	\$90,000	One switch handles 30 GPUs; second deferred to Phase 2.
300 TB NVMe storage, expandable	\$120,000	Right-sized for rental tenants; petabyte tier deferred.
z1Power LFP batteries + UPS	\$80,000	At cost via sponsor-owned z1Power (~\$280K retail equivalent).
HVAC retrofit — Building 1	\$150,000	~30 tons cooling, hot/cold aisle containment for Oklahoma summers.
Racks, PDUs, cabling, optics	\$40,000	Self-performed on owned site.
Management switch, firewall	\$15,000	Out-of-band management + tenant isolation.
Shipping · installation · legal & permitting	\$35,000	Fully itemized — no "misc" bucket.
Contingency (15%)	\$260,000	Unspent contingency returns to the project.
TOTAL CAPEX · RAISE \$2.0M	\$1,990,000	Balance to working capital.

[TIMELINE · GATED, NOT HOPEFUL]

Gate 0 — Six anchor signatures + Q1 prepayments (~\$296K in) before any server order.

Days 0-90 — Dobson fiber build (install waived) || HVAC retrofit || HGX order (8-12 wk lead).

Day ~100 — Fabric up, burn-in, anchor onboarding.

Day ~120 — Revenue. Fiber and servers land on the same clock — neither waits on the other.

[NOT IN THIS ASK]

No land purchase. No building lease. No utility interconnection fees. No retail battery markup. No speculative inventory — 100% of capacity is pre-committed before capital is deployed.

gate 0 is the whole discipline — no signatures, no spend.

ALL 30 GPUS PRE-SOLD.

ZERO MARKET RISK IN YEAR 1.

[CAPACITY MAP · 30 RENTABLE B200S]

A1	A1	A1	A1	A1	A2	A2	A2	A2	A2
A3	A3	A3	A3	A3	A4	A4	A4	A4	A4
A5	A5	A5	A5	A5	A6	A6	A6	A6	A6

A1-A6 SIX ANCHOR TENANTS · 5 GPUS EACH · RESERVED 24/7 · BILLED WHETHER UTILIZED OR NOT · 2 PHYSICAL SPARES HELD OUTSIDE CONTRACTS

REVENUE STREAM	ANNUAL	OPERATING COST	ANNUAL
6 anchors × 5 GPUs · \$4.50/hr · 24/7/365	\$1,182,600	Power & cooling (~110 kW @ OK rates)	\$120,000
On-demand exposure	\$0	Fiber — Dobson 100G DIA, signed quote	\$96,900
GROSS REVENUE — 100% CONTRACTED	\$1,182,600	Team — 2 HPC engineers @ \$120K, OK market	\$240,000
		Insurance, property tax, software	\$40,000
		TOTAL COSTS	\$496,900

[YEAR-1 NET]

\$685,700

58% operating margin · 34.3% Year-1 cash yield on the \$2.0M raise.

Contracted revenue covers total operating costs 2.4× over. No tenant exceeds 17% of revenue. Anchors prepay Q1 (~\$296K) before a dollar of capital deploys — the project starts life 15% pre-funded by customers.

[SENSITIVITY · WHERE THE ANCHOR RATE LANDS]

RESERVED RATE	Y1 NET PROFIT	FLAT-RATE PAYBACK (\$1.99M)	CASH PAYBACK W/ Q1 PREPAY
\$5.00/hr — the ask (20% under market median)	\$817,100	2.4 yr	2.0 yr
\$4.50/hr — modeled landing rate	\$685,700	2.9 yr	2.5 yr
\$4.00/hr — tough negotiation floor	\$554,300	3.6 yr	3.1 yr

Every cell above assumes 100% contracted capacity. Freed on-demand upside (renting the 2 spares, marketplace overflow between contracts) is excluded from all figures.

WE MODEL RATES FALLING. MOST DECKS DON'T.

GPU rental prices decay as newer silicon ships — B300 is already listing at a premium and pulling B200 down-market. The base case below cuts our reserved rate ~9% per year. If rates simply hold at today's levels, every return figure in this memorandum improves by roughly a third.

	YEAR 1	YEAR 2	YEAR 3	YEAR 4	YEAR 5
Reserved rate (\$/GPU-hr) — 30 GPUs contracted	4.50	4.05	3.65	3.29	2.96
Gross revenue	\$1,182,600	\$1,064,340	\$959,220	\$864,612	\$777,888
Operating costs	\$496,900	\$496,900	\$496,900	\$496,900	\$496,900
Net operating cash flow	\$685,700	\$567,440	\$462,320	\$367,712	\$280,988
Cumulative	\$686K	\$1.25M	\$1.72M	\$2.08M	\$2.36M

[CUMULATIVE CASH VS. CAPEX]

[THREE SCENARIOS · \$2.0M RAISE, 5-YR + RESIDUAL]

SCENARIO	PAYBACK	MOIC	IRR
Conservative — land \$4.00, decay	>5 yr	1.1×	4.4%
Base — land \$4.50, decay	3.7 yr	1.4×	12.9%
Strong — \$4.50 holds flat	2.9 yr	1.9×	24.8%

If anchors sign at the \$5.00 ask: 2.9 yr / 1.7× / 20.9% with decay, or 2.4 yr / 2.3× / 32.7% flat. Cash-basis payback (Q1 prepayments ~\$296K in hand) runs ~0.4 yr faster in every scenario. Residual hardware value at Y5 assumed \$450K. Excludes Phase-2 economics and all between-contract marketplace revenue.

[WHAT THE MODEL EXCLUDES — DELIBERATELY] No Phase-2 revenue, no solar savings, no z1Power cross-sell, no rate upside, no utilization above 65% on the on-demand pool. Those are real options this site holds; the returns above don't need them.

FOUR WAYS IN. SAME PRO-RATA ECONOMICS.

Each tier purchases a pro-rata share of project distributions, paid quarterly, from a \$2.0M raise. Figures show the audited base case (\$4.50 landing rate, declining) with the rates-hold case in brackets. Final structure, security type, and terms to be set with counsel — these are illustrative economics, not an offer.

[TIER 01]

POD PARTNER

\$250,000

Project share	12.5%
Year-1 distribution	~\$85,700
5-yr distributions + residual	\$352K [\$485K]
MOIC · IRR	1.4× · 12.9% [1.9× · 24.8%]

Includes: quarterly distributions + reporting, annual site day.

[TIER 02]

RACK PARTNER

\$500,000

Project share	25%
Year-1 distribution	~\$171,400
5-yr distributions + residual	\$704K [\$970K]
MOIC · IRR	1.4× · 12.9% [1.9× · 24.8%]

Adds: priority GPU allocation for investor's portfolio companies at anchor pricing.

[TIER 03]

CORE PARTNER

\$1,000,000

Project share	50%
Year-1 distribution	~\$342,900
5-yr distributions + residual	\$1.41M [\$1.94M]
MOIC · IRR	1.4× · 12.9% [1.9× · 24.8%]

Adds: advisory board seat, quarterly financial review, right of first refusal on Phase-2 raise.

[TIER 04 · FULL BUILD]

SITE PARTNER

\$2,000,000

Project share	100% of investor pool
Year-1 distribution	~\$685,700
5-yr distributions + residual	\$2.81M [\$3.88M]
MOIC · IRR	1.4× · 12.9% [1.9× · 24.8%]

Adds: board seat, co-branding rights, Phase-2 & Phase-3 right of first refusal across the full 30-acre site.

[**DOWNSIDE PROTECTION**] Six signatures + Q1 prepayments (~\$296K) are the gate for deploying capital at all; contracted revenue covers operating costs 2.4× over and no tenant exceeds 17% of revenue. If rates land at \$4.00, IRR compresses but capital still returns over the hardware's life. **Levered option for smaller checks:** a \$1.0M senior equipment loan (11%, 5-yr, DSCR 2.5× — comfortably bankable) plus \$1.0M equity produces a 41.5% Year-1 cash yield on equity and 14.8–36.1% equity IRR across the rate scenarios.

PHASE 1 IS 4% OF THE TRANSFORMER.

[PHASE 1 · THIS RAISE]

30 GPUS - 110 KW

Building 1. Four anchors + on-demand pool.
Cash-flowing in ~120 days from Gate O.

[PHASE 2 · FUNDED BY CASH FLOW]

+60 GPUS - BLDG 2

Second building shell exists; fabric designed for it (second switch slot reserved). Next-gen silicon at then-current pricing.

[PHASE 3 · SITE BUILD-OUT]

SOLAR + BLDG 3

~500 kW solar on 2–3 acres, zPower storage at cost. The transformer supports ~20× today's load before any utility upgrade.

[RISKS & MITIGATIONS — STATED, NOT BURIED]

RISK	MITIGATION
GPU rental rates fall faster than modeled	Base case already prices ~9%/yr decline; anchors billed 24/7 regardless of utilization; conservative floor still returns capital.
Tenant concentration (6 tenants, ≤17% each)	Signatures + prepaid Q1 (~\$296K) required before capital deploys; marketplace demand (Vast.ai-class) backstops any churn; 2 spare GPUs held as failure buffer outside contracts.
Hardware obsolescence	B200 remains mainstream inference silicon through the hold; \$450K residual assumed at Y5 (~26% of equipment), not zero.
Build overruns	15% contingency (\$260K) carried in headline CAPEX; shipping, legal, firewall itemized separately; site, power, and buildings already exist.
Fiber install slips past 90 days	Install cost waived under signed quote; server lead time (8–12 wks) runs in parallel, so slip absorbs into the same window.

[NEXT STEP]

Full model workbook, Dobson quote, site photos, and anchor LOIs available in the data room. Terms finalized with counsel at commitment.

REQUEST THE DATA ROOM →

CONFIDENTIAL — prepared by SmartTec.dev, July 2026. This memorandum is for discussion purposes only and does not constitute an offer to sell or a solicitation to buy securities. Illustrative tier economics assume pro-rata participation in project distributions; final legal structure, security type, preferred terms, and tax treatment to be determined with qualified counsel. Projections are estimates based on July 2026 market data (independent multi-provider B200 price indices; signed Dobson Fiber quote; vendor list pricing) and actual results will differ. GPU rental rates are volatile; hardware values decline; past market pricing does not guarantee future rates. Recipients should conduct independent due diligence.
